

# Efficient SharePoint Control

*What does it  
mean to you?*

## Take advantage of your SharePoint potential without losing control

The capability of running several business applications within a single farm makes Microsoft SharePoint an extremely versatile and useful platform for driving intranets, extranets and other collaboration tasks. It also makes it a complex technology when it comes to control and administration.

In order to ensure high availability, stability, security and lower maintenance costs, it is instrumental to keep full control of the critical configuration parameters and their interdependencies throughout the SharePoint platform.

This can be achieved with a governance approach that encompasses the whole implementation process of SharePoint, from the design phase, in which all the critical configuration parameters are specified, through all the way down to operation and maintenance.

**This is where you can benefit from the unique capabilities of DeltaPoint.**

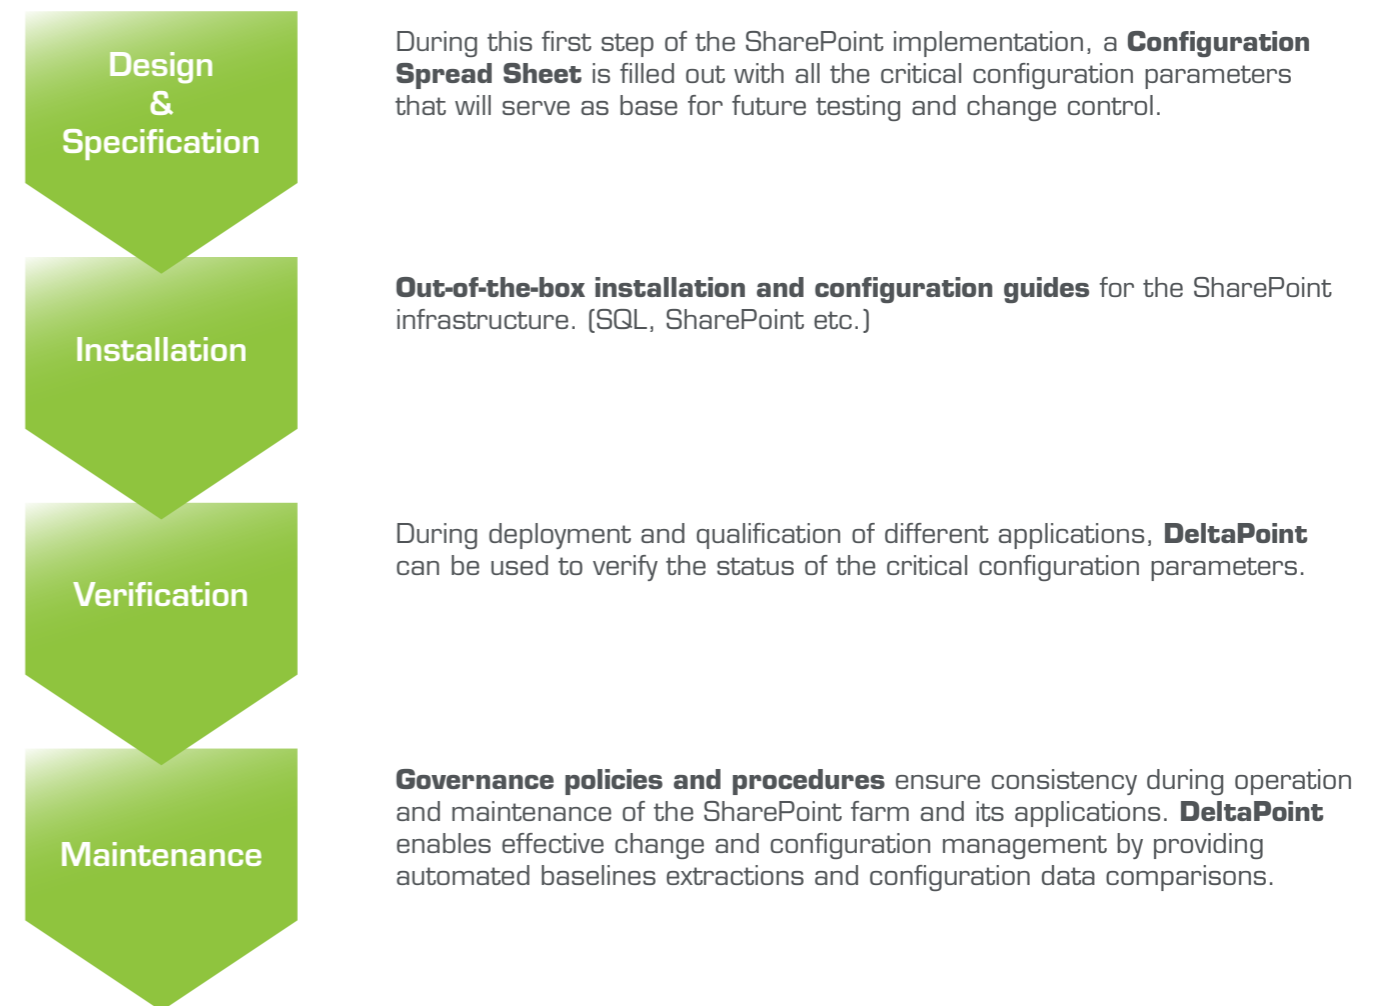

Whenever efficient control of critical configuration is needed, DeltaPoint is the automated governance solution you can rely on, be it during deployment, testing or maintenance of your SharePoint farm and applications.

DeltaPoint extracts and compares baselines automatically, enabling fast and effective change and configuration management and the implementation of reliable SharePoint-based IT projects.

Ultimately, an efficient control will allow you to take advantage of the many possibilities offered by SharePoint and of the business opportunities that they represent.

Overview, compliance,  
high availability...you name it.  
Just let DeltaPoint help you remain in  
control of your SharePoint platform.

DeltaPoint covers the whole implementation process of a SharePoint platform, from design to maintenance, enabling fast and reliable change and configuration management on all levels of the SharePoint farm.

# See how DeltaPoint enables efficient control of your SharePoint platform

**The Configuration Spread Sheet**  
displays all important and critical configuration parameters

**Fast identification of critical configuration parameters**

**Overview of interdependencies between critical configuration parameters**

Data harvesting from **all layers** of the SharePoint platform

Built-in structural **cross-tab reports** covering the server, the SharePoint farm settings, the web applications and sites hosted on the farm

**Overview of shared services** between applications

**Fast, automated baseline extraction**

**Effective change and configuration management**

**Easy testing of the SharePoint environment**

**Fast verification** of critical configuration parameters

**Baseline comparisons** with easy tracking and visualization of changes in configuration

## A SharePoint governance solution for regulated industries

Epista IT's comprehensive understanding of the regulatory requirements set for Life Science industries combined with its advanced knowledge of the relevant technology have enabled us to develop tools and validation processes to bring you the benefits of SharePoint across all areas of your business.

Our validation methodology achieves its goals using a single mixed-use SharePoint infrastructure - including all applications, controlled and non-controlled alike.

In this case, a complete overview of the shared services between applications is a precondition for maintaining SharePoint in a compliant state.

DeltaPoint can help you with that and more by providing in-depth overview of all critical configuration parameters and their interdependencies as well as enabling efficient change control.

For example, the periodic configuration review of validated IT systems can take substantial resources to execute, depending on the scale and scope of a SharePoint farm. With DeltaPoint, the periodic review is performed in a few mouse clicks.

With DeltaPoint at hand, you can focus on analyzing configuration and addressing deviations, instead of spending time in collecting and comparing countless data manually.

\* DeltaPoint is fully compatible with SharePoint 2007 and SharePoint 2010
